

FlowAccel Server Installer (Windows)

Multi-Part Download - Installation Guide

1. Download the package

Download every FlowAccel-Setup-1.0.7z.NNN listed in SHA256SUMS.txt from this folder, plus SHA256SUMS.txt itself. Place all files in one folder (your browser may auto-download all of them after a single "Allow multiple downloads" prompt).

2. Install 7-Zip if you don't already have it

```
winget install 7zip.7zip
```

3. Extract

Right-click FlowAccel-Setup-1.0.7z.001 → **7-Zip** → **Extract Here**

Or from the command line:

```
"C:\Program Files\7-Zip\7z.exe" x FlowAccel-Setup-1.0.7z.001
```

7-Zip auto-detects parts .002 through .005 and produces FlowAccel-Setup-1.0.exe in the same folder.

4. Verify (optional)

```
certutil -hashfile FlowAccel-Setup-1.0.exe SHA256
```

Compare the result to the **extracted** line in SHA256SUMS.txt.

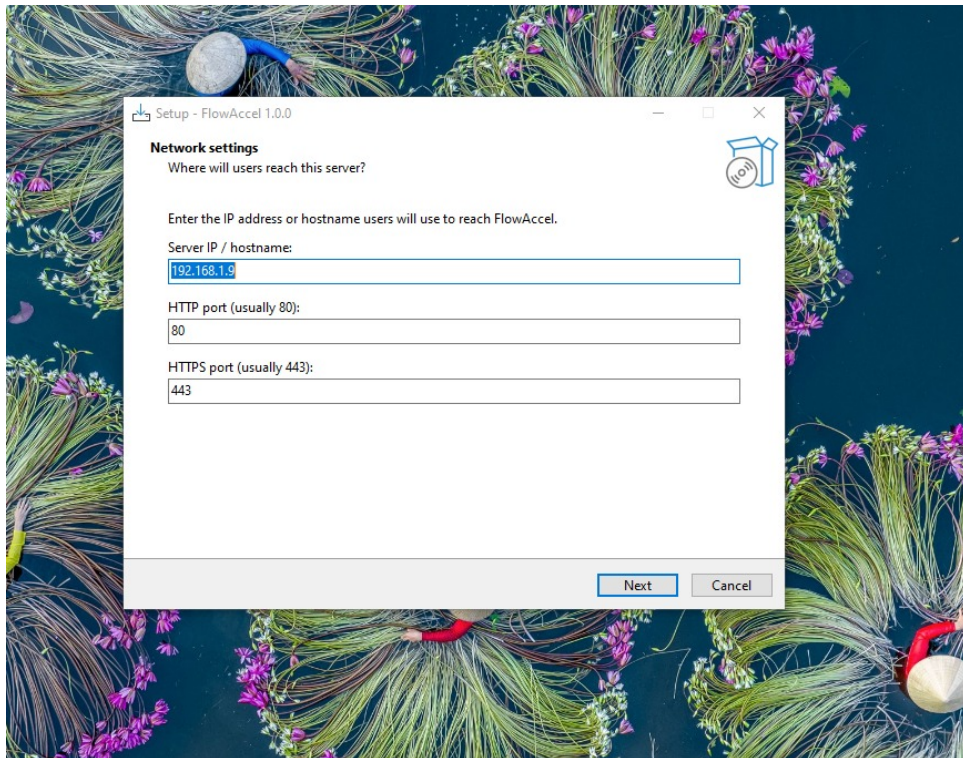

5. Run the installer

Right-click FlowAccel-Setup-1.0.exe and **Run as administrator**. The setup wizard installs Node 18, PostgreSQL 15, IIS URL Rewrite, IIS Application Request Routing, NSSM, and FlowAccel itself.

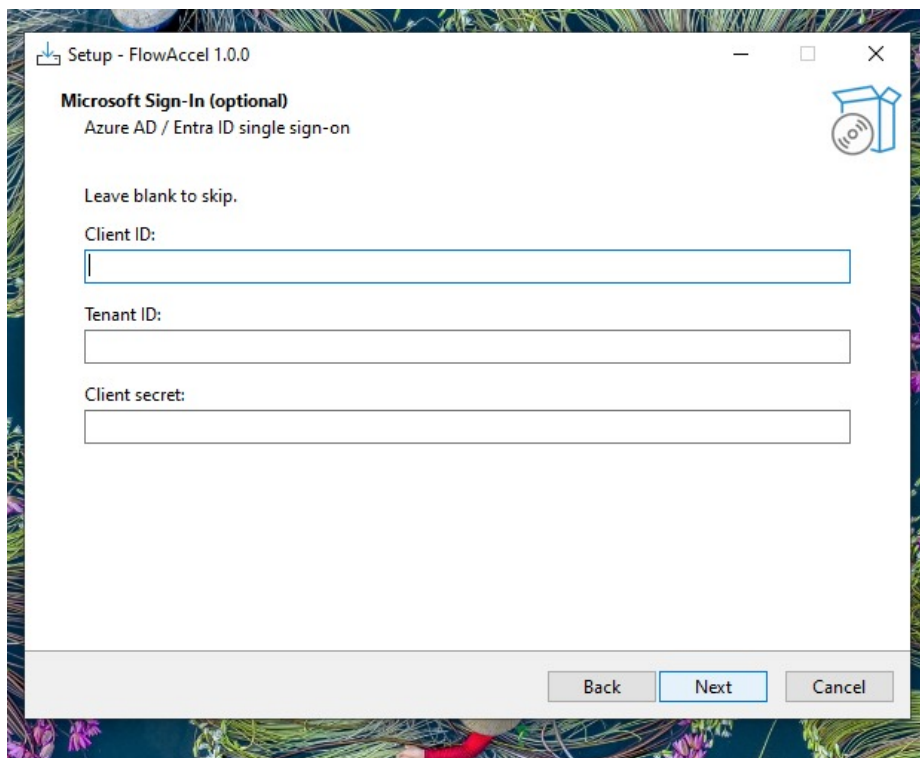

No Inno Setup or Node is required on your machine - the installer is self-contained. Only 7-Zip is needed to unpack the download.

Setup wizard screens

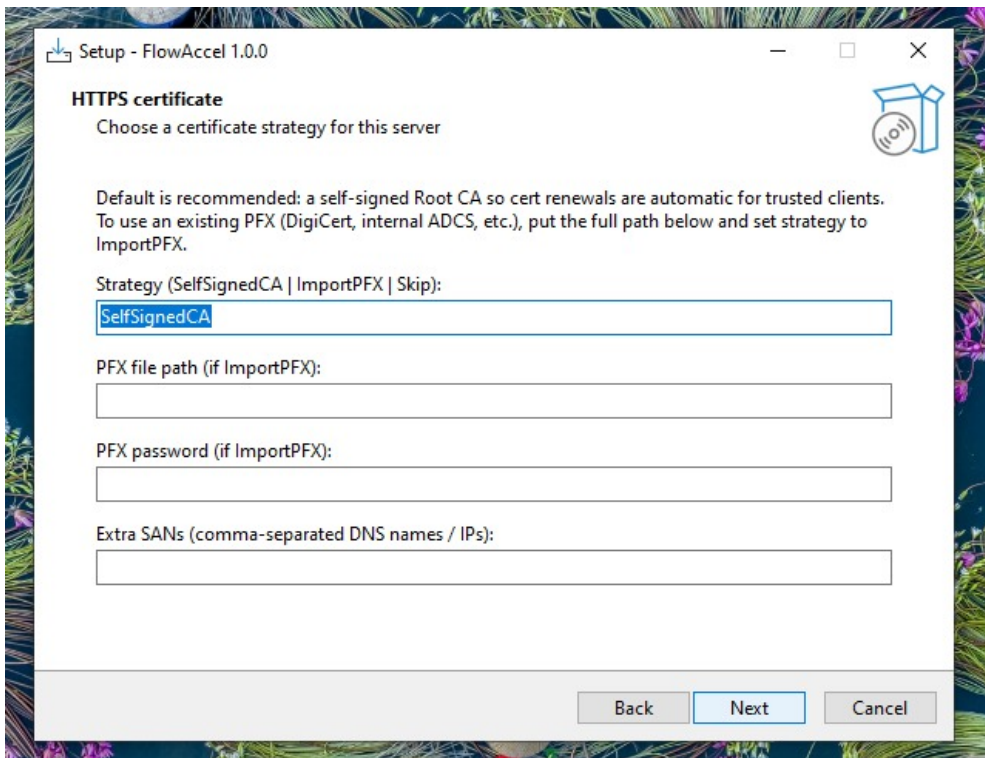

After you click **Run as administrator** in step 5, the wizard presents the following screens in order.

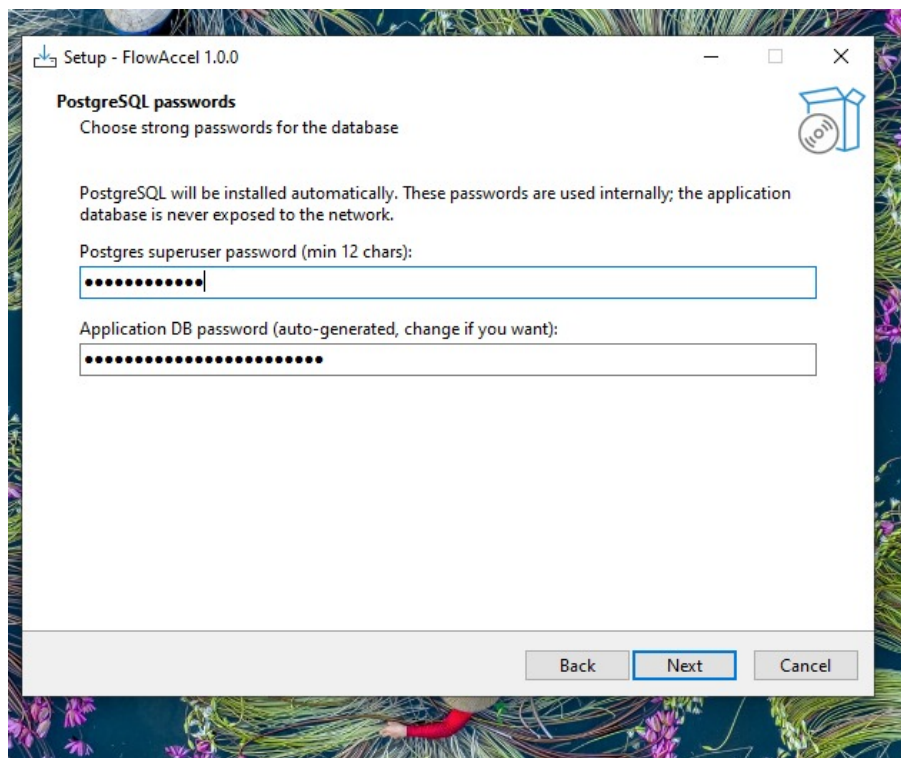

Network settings - server IP and HTTP/HTTPS ports

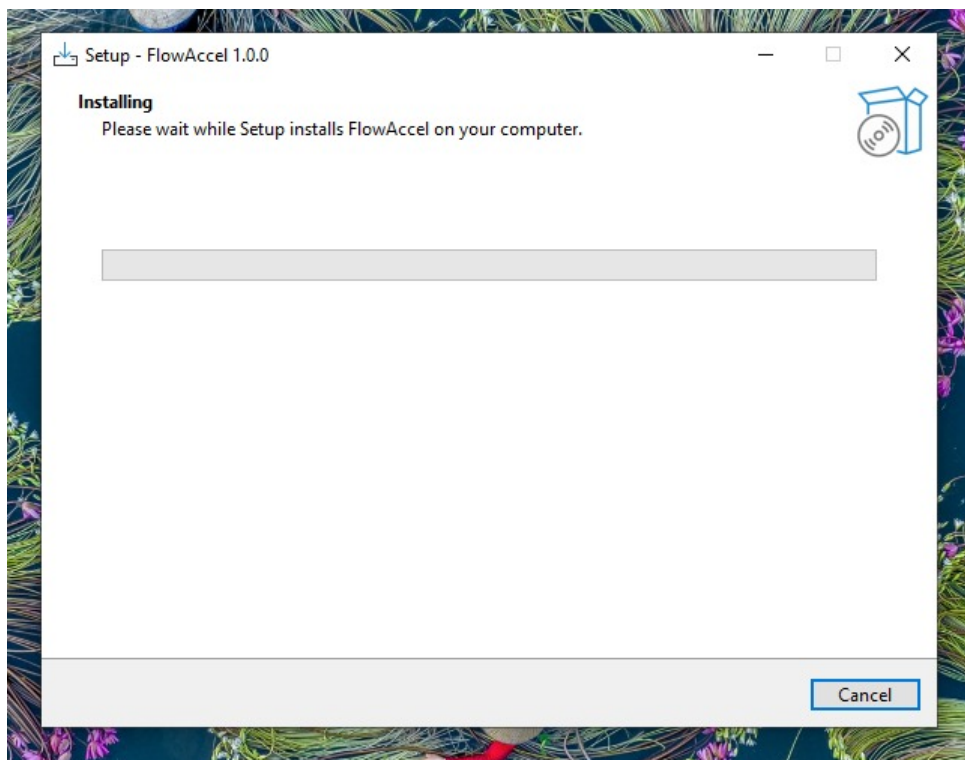

Microsoft Sign-In - leave blank to skip Azure AD SSO

HTTPS certificate - SelfSignedCA is recommended

PostgreSQL passwords - used internally only

Installation in progress
