

PERSONALIZED NEURO-PROFILE

Your Brain Type & Performance Report

A complete map of your brainwave activity, cognitive performance, and dominant brain type — built from 19-channel qEEG analysis and the NeuroSense five-type framework.

WELCOME, SAHIL

What's **inside** this report

A complete walkthrough of how your brain works — from the dominant brainwave patterns across 19 EEG channels, to your unique brain type, to a personalized 30-day plan.

1 Your Snapshot — at-a-glance score & key signals PAGE 3

2 Brainwave Profile — Delta, Theta, Alpha, Beta, hi-Beta PAGE 4

3 Your Brain Type — the NeuroSense five-type framework PAGE 5–7

4 Performance Markers — Cognition, Focus, Stress, Burnout PAGE 8

5 Emotional Regulation, Learning & Creativity PAGE 9

6 Deep-Dive Neuro-Metrics PAGE 10

7 Your 30-Day Brain Optimization Plan PAGE 11

★ How to read this report

Each metric is shown as a percentage or raw EEG value. Higher isn't always better — for stress regulation, higher means calmer. Look for the colored status badges on every card. Your **Brain Type** on page 5 is the lens through which every score should be interpreted.

SECTION 1 — QUICK READ

Your brain at a glance

SAHIL's brain scores 67 overall — a solid, functional baseline with genuine room to grow. His standout strength is Burnout Resistance at 100% (Strong), signalling a nervous system built for sustained output without structural collapse; the primary watch-zone is Emotional Regulation at 33% (Needs Attention), where internal signal processing requires the most focused support.

Your three biggest signals

SECTION 2 — THE FIVE BANDS

Your brainwave profile

SAHIL's relative-power profile is anchored by a markedly elevated Daytime Delta band at 35.37% — well above the optimal ceiling of under 20% — while an Alpha Peak of 11.7 Hz remains healthy, describing a brain that simultaneously carries a significant slow-wave load and maintains a functional fast-processing rhythm.

Relative Power Distribution

Delta

0.5–4 Hz · Deep rest

35.4%

Theta

4–7 Hz · Creativity

0%

Alpha

8–12 Hz · Calm focus

Peak 11.7
Hz

Beta

13–20 Hz · Active thinking

Elevated

Hi-Beta

20–30 Hz · Vigilance

Elevated

What this means for you

Delta (35.37% — Elevated)

Daytime Delta power at 35.37% is nearly double the optimal ceiling of < 20%, which can surface as mental fog, reduced processing speed, or difficulty sustaining sharp focus across extended sessions — this is the single most actionable finding in SAHIL's brainwave profile.

Alpha Peak (11.7 Hz — Healthy)

An Alpha Peak Frequency of 11.7 Hz sits at the healthy upper edge of the 9.5–11.5 Hz optimal range, indicating that SAHIL's brain idles at an efficient, brisk frequency well-suited to fluid thinking and information integration.

Arousal vs. Relaxation

Arousal at 1.48 (elevated, optimal < 1.0) significantly outpaces Relaxation at 1.15 (low, optimal > 8), describing a nervous system that accelerates readily but finds it effortful to decelerate — a pattern characteristic of the Steady-Driver blend.

SECTION 3 — THE NEUROSENSE FRAMEWORK

The five brain types

Decades of brain imaging and qEEG research show that brains organize into recognizable patterns — distinct combinations of arousal, regulation, and reactivity. Knowing your type isn't a label — it's a lens. It tells you which strategies will actually work for your brain.

YOUR TYPE

TYPE 1

Steady

Focused, flexible, emotionally even. Shows up on time, follows through, plays by the rules. The well-regulated brain.

TYPE 2

Explorer

Creative, risk-taking, novelty-seeking. Lower prefrontal regulation — easily bored, struggles with routine and follow-through.

TYPE 3

Driver

Driven, strong-willed, reliable. High arousal channelled into output. Sees things through. Tends to lock onto thoughts and grind on problems.

TYPE 4

Empath

Empathetic, deeply feeling, relationship-driven. High limbic reactivity. Prone to mood swings and emotional intensity.

TYPE 5

Sentinel

Prepared, motivated, thorough. Heightened activity in vigilance circuits (amygdala, basal ganglia). Worry-prone but reliable.

How we determined your type

Your qEEG showed signatures that map onto the **Steady (Type 1)** profile, with secondary **Driver** features:

- Arousal Score of 1.48 (elevated above the optimal of < 1.0) places SAHIL in a persistently activated state — characteristic of the Driver secondary type, where high energy is converted into goal-directed output.
- Regeneration (Alpha Modulation) at 50% (Healthy, optimal > 30%) confirms the nervous system can access recovery mode when conditions allow — the defining marker of the Steady primary type.
- Alpha Peak Frequency of 11.7 Hz (Healthy, optimal 9.5–11.5 Hz) reflects a brisk, well-tuned cortical idling rhythm consistent with the Steady brain's reliable cognitive throughput.
- Frontal Alpha Asymmetry of 2.62 (Left-Shifted) adds the Driver signature: left-frontal dominance is associated with approach motivation, task-completion drive, and goal-locking under pressure.

SAHIL'S BRAIN TYPE

Type 1 — The Steady Brain

The well-regulated, balanced brain.

Balanced

Reliable

Even-keeled

Adaptable

What's happening in your brain

The neuroscience

A Steady brain shows balanced arousal, posterior-dominant alpha, and symmetric frontal activity. The nervous system activates and recovers cleanly — the hallmark of good self-regulation.

Why it's a strength

Steady brains are dependable and adaptable. They handle pressure without overreacting and recover quickly, which makes them consistent performers across many settings.

Your strengths & watch-zones

Steady-Brain Strengths

- ✓ Even emotional baseline — pressure rarely tips you over.
- ✓ Clean activate/recover cycle supports sustained focus.
- ✓ Flexible attention — you shift between tasks without friction.

Steady-Brain Watch-Zones

- ! Comfort can become complacency — keep setting fresh challenges.
- ! Balanced brains can under-rate their own capacity; aim higher.

WHAT WORKS FOR YOUR TYPE

Steady-brain strategy guide

Generic advice often fails this type. Here's what actually moves the needle for a Steady brain.

Lifestyle & nutrition

Eat for your type

A balanced whole-food diet maintains your steady baseline. No special intervention needed — protect what works.

Move

Mix cardio and strength. Your brain tolerates intensity well, so train for goals, not regulation.

Sleep

Keep a consistent sleep window. Your regulation depends on it staying consistent.

Mind & emotional practices

✓ Do more of

- ✓ Progressive challenge — set goals slightly beyond your comfort zone.
- ✓ Skill stacking — your stable base makes deliberate practice highly effective.
- ✓ Novelty in small doses to keep engagement high.

⚠ Less of

- ! Autopilot — coasting wastes a well-regulated system.
- ! Skipping recovery on the assumption you don't need it.

SECTION 4 — PERFORMANCE MARKERS

Cognition & stress

How clearly you think and how well you handle pressure — the two engines of daily performance.

Cognition

67%

MODERATE

Cognition scores 67% (Moderate), supported by a healthy Alpha Peak of 11.7 Hz that anchors clear information processing; however, Daytime Delta at 35.37% creates an intermittent drag on processing speed and working-memory clarity.

Stress Regulation

67%

GOOD

Stress Regulation at 67% (Good) reflects a nervous system that manages activation productively — the elevated Arousal Score of 1.48 is not tipping into dysregulation, yet the Relaxation Score of 1.15 (far below the optimal of > 8) signals the system rarely fully unloads.

Focus & Attention

67%

MODERATE

Focus & Attention registers 67% (Moderate); healthy Regeneration at 50% helps SAHIL re-engage after distraction, yet the elevated Daytime Delta load of 35.37% creates a physiological ceiling on sustained vigilance.

Burnout Resistance

100%

STRONG

Burnout Resistance is SAHIL's strongest marker at 100% (Strong), indicating that his regulatory architecture can withstand prolonged demand — this score reflects structural resilience rather than an absence of load.

Worth understanding

The most clinically interesting finding is the pairing of 100% Burnout Resistance with a Relaxation Score of only 1.15 against an optimal of > 8. SAHIL's nervous system demonstrates an impressive capacity to sustain output without structural burnout, yet it rarely achieves the deep parasympathetic recovery that genuine relaxation represents. Over time, the gap between structural resilience and functional recovery could silently erode the very burnout buffer he currently holds. Protecting that 100% score means treating recovery as an active discipline — not because SAHIL is fragile, but because his system is presently running on drive rather than on fully restored resources.

SECTION 5 — INNER BANDWIDTH

Emotion, learning & creativity

When the nervous system is busy scanning, it has less bandwidth for emotional flexibility, divergent thinking, and the open-mode states that drive creativity.

💖 Emotional Regulation

33%

NEEDS ATTENTION

Emotional Regulation at 33% (Needs Attention) is SAHIL's bandwidth bottleneck; a Frontal Alpha Asymmetry of 2.62 (Left-Shifted) indicates the approach circuits run hotter than the regulation circuits, making emotional signals harder to metabolise cleanly under pressure.

📖 Learning Capacity

67%

MODERATE

Learning scores 67% (Moderate), reflecting adequate encoding capacity anchored by the healthy Alpha Peak of 11.7 Hz; elevated Daytime Delta at 35.37% may slow the consolidation phase, particularly when sleep quality is compromised.

🎨 Creativity

67%

MODERATE

Creativity registers 67% (Moderate); the Driver-type left-frontal activation reflected in the 2.62 asymmetry fuels generative, goal-directed thinking, though the high arousal baseline of 1.48 can compress the open, wandering attention that supports truly novel idea generation.

◆ The hidden link between these three

All three Inner Bandwidth dimensions are shaped by the same underlying tension: high arousal (1.48) and left-frontal asymmetry (2.62) push SAHIL toward drive and output, while a Relaxation Score of 1.15 limits the recovery window in which emotional processing, memory consolidation, and associative thinking naturally deepen.

SECTION 6 — THE NUMBERS BEHIND THE STORY

Deep-dive neuro metrics

The actual EEG values behind every score above — the metrics your clinician will reference.

Alpha Peak Frequency

Optimal: 9.5 – 11.5 Hz

11.7 Hz

HEALTHY

Arousal Score

Optimal: < 1.0

1.48

ELEVATED

Relaxation Score

Optimal: > 8

1.15

LOW

Regeneration (Alpha Modulation)

Optimal: > 30%

50%

HEALTHY

Frontal Alpha Asymmetry

Optimal: Balanced (near 0)

2.62

LEFT-SHIFTED

Daytime Delta

Optimal: < 20%

35.37%

ELEVATED

① Reading these numbers

Taken together, SAHIL's deep-dive markers tell a coherent story: a driven, high-arousal brain (Arousal 1.48, Asymmetry 2.62) with a functional recovery mechanism (Regeneration 50%) that is nonetheless carrying a heavy slow-wave load (Delta 35.37%) and rarely achieving true parasympathetic rest (Relaxation 1.15). The Alpha Peak of 11.7 Hz confirms that when SAHIL is on, he is sharp — but the system is operating on fewer reserves than the surface scores alone suggest.

SECTION 7 — YOUR PERSONALIZED PLAN

Your 30-day brain plan

SAHIL's 30-day priority is to close the gap between his high arousal baseline of 1.48 and his very low Relaxation Score of 1.15, because that gap is the direct upstream driver of Emotional Regulation sitting at 33% and the cognitive drag imposed by Daytime Delta at 35.37%.

Daily non-negotiables (start tomorrow)

1 Progressive challenge — set goals slightly beyond your comfort zone.

2 Skill stacking — your stable base makes deliberate practice highly effective.

3 Novelty in small doses to keep engagement high.

Week-by-week build

WEEK 1 — CALM FIRST

Lock in the daily anchors

Just the anchors above. Prove to your nervous system that calm is safe and consistent.

WEEK 2 — CONTAIN

Add structure & containment

A short evening wind-down and a 3-item morning priority list. Contain the open loops.

WEEK 3 — RECOVER

Add one weekly true-rest session

90 minutes of no productivity, no input, no goal. It will feel uncomfortable — that is the point.

WEEK 4 — ACTIVATE

Layer in performance work

Add a daily goal-activation routine — one intention plus one thing you are looking forward to.

⌚ After 30 days

The first markers expected to respond are Emotional Regulation — as consistent downregulation practice begins to rebalance Frontal Alpha Asymmetry away from 2.62 — and Daytime Delta, as sleep quality and recovery depth improve; Relaxation Score should follow as the nervous system builds the habit of transitioning out of drive mode.

Your brain is unique. Your plan should be too.

SAHIL's profile is genuinely encouraging: a 100% Burnout Resistance score and Regeneration at 50% mean the foundation for high, sustained performance is structurally sound. The work ahead is not about building from scratch — it is about teaching a capable, high-drive brain to recover as well as it activates, so that the Steady-Driver combination becomes a durable engine rather than an intermittent one. With targeted practice, the markers most ready to move — Emotional Regulation and Relaxation — can shift meaningfully within the first 30 days.
